### The Entropy Power

Let X be a d-dimensional random vector (r.v.) with differential entropy h(X). The entropy power of X is

 $N(X) = \exp\left(\frac{2}{d}h(X)\right).$ 

### The Entropy Power

Let X be a d-dimensional random vector (r.v.) with differential entropy h(X). The entropy power of X is

$$N(X) = \exp\left(\frac{2}{d}h(X)\right).$$

The Entropy Power Inequality (EPI)

Let  $\{X_k\}_{k=1}^n$  be independent r.v.'s. Then,

$$N\left(\sum_{k=1}^{n} X_k\right) \ge \sum_{k=1}^{n} N(X_k)$$

and equality holds if and only if  $\{X_k\}_{k=1}^n$  are Gaussians with proportional covariances.

Is there a positive constant  $c^{(n,d)}_{\alpha}$  such that

$$N_{\alpha}\left(\sum_{k=1}^{n} X_{k}\right) \ge c_{\alpha}^{(n,d)} \sum_{k=1}^{n} N_{\alpha}(X_{k})?$$

# Upper and Lower Bounds on $c^{(n,d)}_{\alpha}$

• For independent Gaussian random vectors with proportional covariances,  $N_{\alpha} \left( \sum_{k=1}^{n} X_{k} \right) = \sum_{k=1}^{n} N_{\alpha}(X_{k}).$  $\Rightarrow c_{\alpha}^{(n,d)} \leq 1$ 

• Trivial Bound - 
$$c_{\alpha}^{(n,d)} \ge 0$$

### Sharpened Young's Inequality

Let  $p,q,r \ge 1$  satisfy  $\frac{1}{p} + \frac{1}{q} = 1 + \frac{1}{r}$  and let  $f \in L^p(\mathbb{R}^d)$  and  $g \in L^q(\mathbb{R}^d)$  be non-negative functions. Then

$$||f * g||_r \le \left(\frac{A_p A_q}{A_r}\right)^{\frac{d}{2}} ||f||_p ||g||_q,$$

where  $A_t = t^{\frac{1}{t}} t'^{-\frac{1}{t'}}$  and  $t' = \frac{t}{t-1}$ .

• Equality holds if and only if f and g are Gaussians.

• Reversed for  $p, q, r \in (0, 1)$ .

◇□◇ □□ ◇□ ◇ □ ◇ ○○

### Sharpened Young's Inequality

Let  $p,q,r \ge 1$  satisfy  $\frac{1}{p} + \frac{1}{q} = 1 + \frac{1}{r}$  and let  $f \in L^p(\mathbb{R}^d)$  and  $g \in L^q(\mathbb{R}^d)$  be non-negative functions. Then

$$||f * g||_r \le \left(\frac{A_p A_q}{A_r}\right)^{\frac{d}{2}} ||f||_p ||g||_q,$$

where  $A_t = t^{\frac{1}{t}} t'^{-\frac{1}{t'}}$  and  $t' = \frac{t}{t-1}$ .

• Equality holds if and only if f and g are Gaussians.

• Reversed for  $p, q, r \in (0, 1)$ .

### Monotonicity of Rényi Entropy Power in its Order

Let  $\alpha, \beta \in (0, 1) \cup (1, \infty)$  such that  $\beta \leq \alpha$  and let  $f \in L^{\alpha} \cap L^{1}$  be a non-negative function such that  $\|f\|_{1} = 1$ . Then,

$$\|f\|_{\beta}^{\beta'} \le \|f\|_{\alpha}^{\alpha'}.$$

### Combining the Two Inequalities

Proposition 1: Let  $\mathcal{P}^n = \{ \underline{t} \in \mathbb{R}^n : t_k \ge 0, \sum_{k=1}^n t_k = 1 \}$  be the probability simplex and let  $\alpha > 1$ . If  $\sum_{k=1}^n N_\alpha(X_k) = 1$ , then

$$\log N_{\alpha}\left(\sum_{k=1}^{n} X_{k}\right) \geq f_{0}(\underline{t}), \ \forall \, \underline{t} \in \mathcal{P}^{n},$$

where

• 
$$f_0(\underline{t}) = \frac{\log \alpha}{\alpha - 1} - D(\underline{t} || \underline{N}_\alpha) + \alpha' \sum_{k=1}^n \left(1 - \frac{t_k}{\alpha'}\right) \log \left(1 - \frac{t_k}{\alpha'}\right)$$
  
•  $\underline{N}_\alpha = (N_\alpha(X_1), \dots, N_\alpha(X_n))$ .  
•  $D(\underline{t} || \underline{N}_\alpha) = \sum_{k=1}^n t_k \log \left(\frac{t_k}{N_\alpha(X_k)}\right)$ .

### Combining the Two Inequalities

Proposition 1: Let  $\mathcal{P}^n = \{ \underline{t} \in \mathbb{R}^n : t_k \ge 0, \sum_{k=1}^n t_k = 1 \}$  be the probability simplex and let  $\alpha > 1$ . If  $\sum_{k=1}^n N_\alpha(X_k) = 1$ , then

$$\log N_{\alpha}\left(\sum_{k=1}^{n} X_{k}\right) \geq f_{0}(\underline{t}), \ \forall \, \underline{t} \in \mathcal{P}^{n},$$

where

• 
$$f_0(\underline{t}) = \frac{\log \alpha}{\alpha - 1} - D(\underline{t} || \underline{N}_\alpha) + \alpha' \sum_{k=1}^n \left(1 - \frac{t_k}{\alpha'}\right) \log \left(1 - \frac{t_k}{\alpha'}\right)$$
  
•  $\underline{N}_\alpha = (N_\alpha(X_1), \dots, N_\alpha(X_n))$ .  
•  $D(\underline{t} || \underline{N}_\alpha) = \sum_{k=1}^n t_k \log \left(\frac{t_k}{N_\alpha(X_k)}\right)$ .

 $\Rightarrow$  The bound can be tightened by maximizing  $f_0(\underline{t})$ .

• This problem can be shown to be convex by a non trivial use of the next result from matrix theory (Bunch *et al.* 1978).

◇□◇ □□ ◇□ ◇ □ ◇ ○○

### Rank-One Modification Theorem (Bunch et al. 1978)

Let

- $D \in \mathbb{R}^{n \times n}$  be a diagonal matrix with the eigenvalues  $d_1 \leq d_2 \leq \ldots \leq d_n$ .
- $z \in \mathbb{R}^n$  such that  $||z||_2 = 1$ ,  $\rho \in \mathbb{R}$  and  $C = D + \rho z z^T$ .
- $\lambda_1 \leq \lambda_2 \leq \ldots \leq \lambda_n$  be the eigenvalues of C.

### Rank-One Modification Theorem (Bunch et al. 1978)

Let

- $D \in \mathbb{R}^{n \times n}$  be a diagonal matrix with the eigenvalues  $d_1 \leq d_2 \leq \ldots \leq d_n$ .
- $z \in \mathbb{R}^n$  such that  $||z||_2 = 1$ ,  $\rho \in \mathbb{R}$  and  $C = D + \rho z z^T$ .
- $\lambda_1 \leq \lambda_2 \leq \ldots \leq \lambda_n$  be the eigenvalues of C.

Then,

- $\lambda_i = d_i + \rho \mu_i$ , where  $\sum_{i=1}^n \mu_i = 1$  and  $\mu_i \ge 0$  for all  $i \in \{1, \dots, n\}$ .
- **2** If  $\rho > 0$ , then  $d_1 \le \lambda_1 \le d_2 \le \lambda_2 \le \ldots \le d_n \le \lambda_n$ . If  $\rho < 0$ , then  $\lambda_1 \le d_1 \le \lambda_2 \le d_2 \le \ldots \le \lambda_n \le d_n$ .
- 3 If  $d_j \neq d_i$  and  $z_i, \rho \neq 0$ , then the inequalities are strict, and for every  $i \in \{1, \ldots, n\}$ ,  $\lambda_i$  is a zero of  $W(x) = 1 + \rho \sum_{j=1}^n \frac{z_i^2}{d_j x}$ .

# Summary (Cont.)

Theorem 1 is obtained by tightening the recent R-EPI by Bobkov and Chistyakov with the same analytical tools:

- Monotonicity of  $N_{\alpha}(X)$  in  $\alpha$ ,
- The sharpened Young's inequality.

# Summary (Cont.)

Theorem 1 is obtained by tightening the recent R-EPI by Bobkov and Chistyakov with the same analytical tools:

- Monotonicity of  $N_{\alpha}(X)$  in  $\alpha$ ,
- The sharpened Young's inequality.

Theorem 2, providing a further improvement of the R-EPI, also relies on the following analytical tools:

- Solution of the Karush-Kuhn-Tucker (KKT) equations of the related optimization problem;
- Strong Lagrange duality in convex optimization where convexity is asserted by invoking a theorem in matrix theory regarding the rank-one modification of a real-valued symmetric matrix.

### Applications

It is our hope that the various important applications of the EPI in information theory, together with the applicability of Rényi measures, will encourage the study of potential applications of Rényi EPIs.

### Applications

It is our hope that the various important applications of the EPI in information theory, together with the applicability of Rényi measures, will encourage the study of potential applications of Rényi EPIs.

E. Ram and I. Sason, "On Rényi Entropy Power Inequalities," submitted to the *IEEE Trans. on Information Theory* in January 2016, and revised in June 2016. http://arxiv.org/abs/1601.06555.

### A Discussion for $\alpha \in (0, 1)$

• 
$$\alpha \in (0,1) \implies \alpha' < 0 \quad (\alpha' = \frac{\alpha}{\alpha - 1}).$$

• Reverse Sharpened Young's Inequality: for  $0 < \alpha, \nu_1, \nu_2 < 1$  such that  $\frac{1}{\alpha'} = \frac{1}{\nu'_1} + \frac{1}{\nu'_2}$  and  $f, g \ge 0$ ,

$$||f * g||_{\alpha} \ge \left(\frac{A_{\nu_1}A_{\nu_2}}{A_{\alpha}}\right)^{\frac{d}{2}} ||f||_{\nu_1} ||g||_{\nu_2}.$$

•  $\alpha \in (0,1) \implies 0 < \alpha < \nu_1, \nu_2 \implies N_{\alpha}(X_k) \ge N_{\nu_k}(X_k).$ 

### A Discussion for $\alpha \in (0, 1)$

• 
$$\alpha \in (0,1) \implies \alpha' < 0 \quad (\alpha' = \frac{\alpha}{\alpha - 1}).$$

• Reverse Sharpened Young's Inequality: for  $0 < \alpha, \nu_1, \nu_2 < 1$  such that  $\frac{1}{\alpha'} = \frac{1}{\nu'_1} + \frac{1}{\nu'_2}$  and  $f, g \ge 0$ ,

$$\|f * g\|_{\alpha} \ge \left(\frac{A_{\nu_1}A_{\nu_2}}{A_{\alpha}}\right)^{\frac{d}{2}} \|f\|_{\nu_1} \|g\|_{\nu_2}.$$

• 
$$\alpha \in (0,1) \implies 0 < \alpha < \nu_1, \nu_2 \implies N_{\alpha}(X_k) \ge N_{\nu_k}(X_k).$$

### Question

In view of these reversed inequalities, can we derive a reversed R-EPI for  $\alpha \in (0,1)$  ?

# Discussion for $\alpha \in (0,1)$ (Cont.)

• Unfortunately, our bounding technique is not extendable for  $\alpha \in (0, 1)$ . Since  $\alpha' < 0$  then  $-\frac{2\alpha'}{d} > 0$ , and with  $A = \frac{1}{A_{\alpha}} \prod_{k=1}^{n} A_{\nu_k}$ :

$$N_{\alpha} \left( \sum_{k=1}^{n} X_{k} \right) = (\|f_{X_{1}} * \dots * f_{X_{n}}\|_{\alpha})^{-\frac{2\alpha'}{d}}$$
$$\geq A^{-\frac{2\alpha'}{d}} \prod_{k=1}^{n} (\|f_{X_{k}}\|_{\nu_{k}})^{-\frac{2\alpha'}{d}}$$

# Discussion for $\alpha \in (0,1)$ (Cont.)

• Unfortunately, our bounding technique is not extendable for  $\alpha \in (0, 1)$ . Since  $\alpha' < 0$  then  $-\frac{2\alpha'}{d} > 0$ , and with  $A = \frac{1}{A_{-}} \prod_{k=1}^{n} A_{\nu_k}$ :

$$N_{\alpha} \left( \sum_{k=1}^{n} X_{k} \right) = \left( \| f_{X_{1}} * \dots * f_{X_{n}} \|_{\alpha} \right)^{-\frac{2\alpha'}{d}} \\ \ge A^{-\frac{2\alpha'}{d}} \prod_{k=1}^{n} \left( \| f_{X_{k}} \|_{\nu_{k}} \right)^{-\frac{2\alpha'}{d}}$$

The reverse Young's inequality still leads to a lower bound.

2nd reverse inequality  $\implies$  an upper bound to a lower bound :(.

# Discussion for $\alpha \in (0,1)$ (Cont.)

• Unfortunately, our bounding technique is not extendable for  $\alpha \in (0, 1)$ . Since  $\alpha' < 0$  then  $-\frac{2\alpha'}{d} > 0$ , and with  $A = \frac{1}{A_{\alpha}} \prod_{k=1}^{n} A_{\nu_k}$ :

$$N_{\alpha}\left(\sum_{k=1}^{n} X_{k}\right) = \left(\|f_{X_{1}} * \dots * f_{X_{n}}\|_{\alpha}\right)^{-\frac{2\alpha'}{d}}$$
$$\geq A^{-\frac{2\alpha'}{d}} \prod_{k=1}^{n} \left(\|f_{X_{k}}\|_{\nu_{k}}\right)^{-\frac{2\alpha'}{d}}$$

The reverse Young's inequality still leads to a lower bound.
 2nd reverse inequality ⇒ an upper bound to a lower bound :(.

- The Bercher & Vignat (BV) bound still holds for  $\alpha \in (0, 1)$ :  $N_{\alpha} \left( \sum_{k=1}^{n} X_{k} \right) \geq \max_{1 \leq k \leq n} N_{\alpha}(X_{k}).$
- For independent Gaussian random vectors with proportional covariances, N<sub>α</sub> (Σ<sup>n</sup><sub>k=1</sub> X<sub>k</sub>) = Σ<sup>n</sup><sub>k=1</sub> N<sub>α</sub>(X<sub>k</sub>) also for α ∈ (0,1).
   ⇒ <sup>1</sup>/<sub>n</sub> ≤ c<sup>(n,d)</sup><sub>α</sub> ≤ 1 for α ∈ (0,1).
